1.0 INTRODUCTION

Peer Engineering, Inc. (Peer) was retained by Minneapolis Community Planning and Economic Development (CPED) to conduct a Limited Site Investigation (LSI) of the Scherer Brothers Lumber Company properties located at 9 8th Avenue NE, 15 8th Avenue NE; 9 and 52 9th Avenue NE; and 807, 900, and 907 Sibley Street NE in Minneapolis, Minnesota (the Site). CPED plans to purchase a portion of the Site to facilitate re-development. The purpose of this LSI was to assess potential subsurface contamination due to past use of the Site.

2.0 BACKGROUND

2.1 SITE DESCRIPTION

The Site is composed of seven parcels totaling approximately 13.87 acres in size. The Site is bounded by 10th Avenue NE and commercial and industrial property to the north, Ramsey Street and commercial and industrial property to the east, 8th Avenue NE to the south and the Mississippi River to the west, as indicated on **Figure 1**.

The Site is currently owned and occupied by Scherer Bros. Lumber Company. The Site consists of nine buildings and paved storage areas previously used as a retail lumber and building supply facility.

2.2 PREVIOUS ENVIRONMENTAL REPORTS

The following environmental reports have been completed for the Site:

- *Phase One Environmental Site Assessment, Scherer Brothers Lumber Company Propoerty, 9 9th Ave NE, 52 9th Ave NE, 15 8th Ave NE, 9 8th Ave NE, 807 Sibley St NE, 900 Sibley St NE, 907 Sibley St NE Minneapolis, Minnesota, dated November, 2009, prepared by Liesch Associates, Inc. (the 2009 Liesch Phase I).*

- *Limited Phase Two Environmental Site Assessment, Part of Scherer Bros Lumber Property, 9 9th Avenue Northeast, Minneapolis, Minnesota, dated October 22, 2009, prepared by Liesch Associates, Inc. (the 2009 Liesch Phase II).*

- *Limited Soil Investigation Report, Scherer Brothers Property, 9 Ninth Avenue NE and 900 Sibley Street NE, Minneapolis, Minnesota, dated March 31, 2010, prepared by R.J. Rykken Consulting, Inc. (the 2010 RJR LSI).*

The 2009 Liesch Phase II consisted of twelve soil borings (B-1 through B-12) advanced to depths ranging from 16 to 119 feet below ground surface (bgs) in the locations shown on **Figure 2**. Liesch identified elevated levels of lead, diesel range organics (DRO), polynuclear aromatic hydrocarbons (PAHs), and the volatile organic compound (VOC) naphthalene in the southwest portion of the Site. The elevated levels were reported to the Minnesota State Duty Officer in July, 2009.

The 2009 Liesch Phase I identified a Minnesota Pollution Control Agency (MPCA) leaking underground storage tank (LUST) site (Leak #1057) next to the maintenance garage at 52 9th Avenue NE.

The 2010 RJR LSI consisted of twenty push probe soil borings (SB-1 through SB-20) in the locations shown on **Figure 2**. The LSI identified elevated levels of PAHs, lead, arsenic, mercury, and cadmium in fill materials on the 900 Sibley Street NE parcel.

3.0 LSI ACTIVITIES

A description of the LSI and associated documentation is provided in the following sections. Methods and procedures are presented in **Appendix A**.

3.1 FIELD INVESTIGATION

3.1.1 Overview

The LSI included the following general elements:

- Completion of twenty geoprobe borings to a depth of 12 feet bgs.
- Completion of three geotechnical borings to a depth of 60 feet bgs.
- Collection of soil samples from the geoprobes and geotechnical borings for organic vapor monitoring, classification and possible laboratory analysis.
- Collection and laboratory analysis of two ground water samples from temporary monitoring wells in two geoprobe locations.
- Laboratory analysis of select soil samples.

The geoprobe and geotechnical boring locations are shown on **Figure 2**. The boring locations were selected based on discussions with CPED representatives, historic aerial photographs, and to obtain representative spatial coverage of the Site. Several borings were located in the area of the former and existing petroleum underground storage tanks (USTs), dispensers and maintenance building to assess potential contamination from these sources.

3.1.2 Utility Clearance

Prior to the start of investigation activities, the drilling subcontractors Bergerson Caswell, Inc. (Bergerson) of Maple Plain, Minnesota and American Engineering Testing, Inc. (AET) of St. Paul, Minnesota notified the Gopher One-Call System to clear public utilities at the Site. The Site owner cleared private utilities at the Site.

3.1.3 Geoprobes

Twenty geoprobe borings (GP-1 through GP-20) were advanced at the Site on April 22 and 23, 2010 by Bergerson using a hydraulic push-probe rig. With the exception of boring GP-13, which was abandoned after losing the sampling equipment, all geoprobe borings were completed to a depth of 12 feet bgs.

Soil samples were collected continuously until the termination depth of each geoprobe boring. The soil samples were screened in the field for organic vapors using a photoionization detector (PID) equipped with a 10.6 eV lamp and were examined for evidence of potential contamination including odors, staining or debris. Soil samples were selected for laboratory analysis based on visual observations and PID screening results, and to assess potential sources of contamination. Soil boring logs are included in **Appendix B**.

All sampling equipment was decontaminated prior to use to reduce the risk of potential cross-contamination. Upon completion, the soil borings were abandoned in accordance with Minnesota Department of Health (MDH) regulations.

3.1.4 Temporary Monitoring Wells

Two temporary monitoring wells were installed in geoprobe borings GP-13A and GP-14. The temporary monitoring wells were constructed of PVC casing and screen materials. The wells were purged and sampled using dedicated polyethylene tubing and a check valve. Two ground water samples were submitted for laboratory analysis. Water levels were measured in each temporary well using an electronic water level meter.

3.1.5 Geotechnical Borings

Three geotechnical borings (B-1-2010 through B-3-2010) were advanced at the Site on April 26 and 28, 2010 by AET using a hollow stem auger drill rig. All geotechnical borings were completed to depths of 60 feet bgs.

Soil samples collected to depths of 16 feet bgs were screened in the field for organic vapors using a PID equipped with a 10.6 eV lamp and were examined for evidence of potential contamination including odors, staining or debris. One soil sample {B-3-2010 (1'-2')} was selected for laboratory analysis based on visual observations and PID screening results.

All sampling equipment was decontaminated prior to use to reduce the risk of potential cross-contamination. Upon completion, the soil borings were abandoned in accordance with MDH regulations.

AET prepared a "Report of Subsurface Exploration and Geotechnical Review, dated May 11, 2010" (AET Geotechnical Report) providing preliminary foundation and other construction recommendations for the Site. The AET Geotechnical Report was submitted to CPED under separate cover.

3.2 ANALYTICAL TESTING

Selected soil and ground water samples collected during the LSI were submitted to Pace Analytical Services, Inc. (Pace) for analytical testing. The samples were analyzed for a combination of the following parameters:

Soil Samples

- DRO using the WDNR Method.
- VOCs using Environmental Protection Agency (EPA) Method 8260.
- PAHs using EPA Method 8270.
- Total Resource Conservation and Recovery Act (RCRA) Metals using various EPA Methods.
- Toxicity Characteristic Leach Procedure (TCLP) lead using EPA methods 1311/6010.

Groundwater Samples

- VOCs using EPA Method 8260.
- DRO using the WDNR Method.

4.0 INVESTIGATION RESULTS

4.1 HYDROGEOLOGY

Regional

The surface elevation of the Site is approximately 810 feet National Geodetic Vertical Datum (NGVD). The terrain is relatively level. Based on published information, surficial soils in the vicinity of the Site consist of postglacial deposits composed of clay and silt, mixed with very fine sand and organic matter; and loamy sand and gravel with thin beds of fine sediment and organic matter. The depth to bedrock ranges from 100 to 150 feet bgs and consists of the St. Peter Sandstone Formation.

The regional groundwater table occurs less than 10 feet bgs. The estimated direction of region groundwater flow is southwest toward the Mississippi River. It should be noted that the depth and gradient of the water table might change seasonally in response to variations in precipitation and recharge, and over time in response to urban development such as stormwater controls, impervious surfaces, and pumping wells.

Site-Specific

The geoprobe and geotechnical borings completed during this LSI generally encountered sand, gravelly sand, silty clayey sand, clayey sand and clay from the ground surface to the termination depth. Fill was encountered in all twenty of the borings at depths ranging from approximately 0.5 to 7 feet bgs. The deepest fill was encountered in GP-1. Fill soils generally consisted of sand with various amounts of debris (see section 4.2). Soil boring logs are included in **Appendix B.**

Groundwater was observed and estimated at depths ranging from 7 to 11 feet bgs in all of the borings. Ground water was encountered and measured at depths of 9.7 and 9.8 feet bgs in borings GP-13A and GP-14, respectively.

4.2 ORGANIC VAPOR SCREENING/FIELD OBSERVATIONS

Elevated organic vapor (PID) readings, greater than 3.0 parts per million (ppm), were measured in the soil samples collected from geoprobes GP-7, GP-13A, and GP-14 and geotechnical boring B-3-2010. PID reading of 10 ppm was measured in the interval between 0.5 and 4 feet bgs in GP-7. PID readings of 12 ppm and 4 ppm were measured in the interval between 10 and 12 feet bgs in GP-13A and GP-14, respectively. PID reading of 70 ppm was measured in the interval between 1 and 2 feet bgs in B-3-2010. No other elevated PID readings (greater than 3.0 ppm) were measured in any other soil samples collected during the LSI. Sample depths and PID screening results are included on the geoprobe boring logs (**Appendix B**).

Varying amounts of debris (wood, metal, brick, slag and/or ash) were observed in soil samples collected from all of the geoprobe locations in the upper fill material from depths ranging from 0.5 to 7 feet bgs.

Petroleum odors were noted in soil samples collected from geoprobe borings GP-13A and GP-14 at the 10 to 12 foot interval and from geotechnical boring B-3-2010 at the 1 to 4 foot interval.

4.3 ANALYTICAL TESTING RESULTS

4.3.1 Soil Analytical Results

Twenty-two soil samples were submitted for analysis. The soil analytical results are presented in **Table 1**. For comparison purposes, **Table 1** also lists the Residential Soil Reference Values (R-SRVs) and Industrial Soil Reference Values (I-SRVs) and Tier 1 Soil Leaching Values (SLVs) established by the MPCA. A copy of the laboratory analytical report and chain-of-custody forms for the soil samples are included in **Appendix C**.

The following observations are provided regarding the soil analytical results:

- The VOCs chloroform and cis-1,2-dichloroethene (cis-1,2-DCE) were detected above the laboratory reporting limits in GP-7 (1-4') and trichloroethene (TCE) was detected above laboratory reporting limits in GP-7 (1-4') and GP-13A (10-12'). The cis-1,2-DCE and TCE concentrations in GP-7 (1-4') exceeded the established Tier I SLVs. No other VOC were reported above laboratory reporting limits in the samples analyzed for this parameter.
- PAHs were detected in 19 of the 21 soil samples analyzed for PAHs. The Benzo(a)pyrene (BaP) equivalent concentrations exceeded the established R-SRV in GP-18 (2.5-4'), the I-SRV in GP-7 (1-4') and GP-9 (0.5-2') and both the I-SRV and Tier I SLV in GP-3 (1-4'). All other PAH concentrations were below established SRVs and SLVs.

- Measurable concentrations of arsenic were detected in all 21 soil samples analyzed for metals. The arsenic concentrations exceed the R-SRV in 13 of the 21 samples, exceed the Tier I SLV in 8 of these samples, and exceed the I-SRVs in 6 of these samples.
- Cadmium, chromium and/or selenium concentrations exceeded the Tier I SLV in 16 of the 21 soil samples analyzed for metals.
- The lead concentration of 2,120 milligrams per kilogram (mg/kg) detected in GP-7 (1-4') exceeds the I-SRV and Tier I SLV. The lead concentration of 631 mg/kg in GP-15 (0.5-3') exceeds the R-SRV and Tier I SLV. TCLP lead concentrations in these samples (**Table 2**) did not exceed the regulatory level of 5 milligrams per liter (mg/l).
- The mercury concentration of 0.69 mg/kg detected in GP-7 (1-4') exceeds the R-SRV. The mercury concentration of 1.8 mg/kg detected in GP-16 (0.5-4') exceeds both the I-SRV and the Tier I SLV.
- DRO was detected in the 3 of the 5 soil samples analyzed for this parameter. DRO concentrations ranged from 209 mg/kg in GP-14 (1.5-4') to 1,130 mg/kg in B-3-2010 (1-2'). There are no established SRVs or SLVs for DRO in soil.

4.3.2 Ground water Analytical Results

The groundwater analytical results are presented in **Table 3**. For comparison purposes, **Table 3** also lists the MDH Health Risk Limits (HRLs). A copy of the laboratory analytical report and chain-of-custody forms for the ground water samples are included in **Appendix C**.

Ground water samples were collected from temporary monitoring wells installed in geoprobe borings GP-13A and GP-14.

The following observations are provided regarding the groundwater analytical results:

- Several VOCs were detected above laboratory reporting limits in GP-13A-W and GP-14W. The TCE concentration of 7.5 micrograms per liter (µg/L) exceeded the established HRL in GP-13A-W. The vinyl chloride concentration of 2.4 µg/L exceeded the established HRL in GP-14W. Detected concentrations of benzene and cis-1,2-Dichloroethylene (cis-1,2-DCE) did not exceed HRLs. No other VOC were detected above laboratory reporting limits.
- DRO was detected in the ground water sample collected from both GP-13A-W and GP-14W at concentrations of 430 µg/L and 1,400 µg/L, respectively. The DRO concentrations exceed the provisional MDH Health Based Value for Total Petroleum Hydrocarbons (TPH) of 200 µg/L. Currently, there are no established HRLs for DRO.

5.0 SUMMARY AND CONCLUSIONS

The LSI was conducted to further evaluate soil and ground water contamination at the Site and to determine if response actions are necessary for redevelopment of the Site. The following conclusions are provided regarding the LSI results:

- The geoprobes and geotechnical borings completed during this LSI encountered sand, gravelly sand, silty clayey sand, clayey sand and clay from the ground surface to 12 feet bgs. Fill was encountered in all twenty of the geoprobes at depths ranging from approximately 3.5 to 7 feet bgs. Fill soils generally consisted of sand with various amounts of gravel and debris. Groundwater was encountered at estimated depths ranging from 7 to 11 feet bgs in all of the soil boring locations.

- Organic vapors were measured and petroleum odors were noted in soil samples collected from borings GP-13A and GP-14, located near the petroleum USTs and dispenser adjacent to the maintenance building. Laboratory analyses detected DRO in soil and ground water samples collected from these borings. Based on the field monitoring and laboratory data, the DRO concentrations appear to be related to the historic petroleum release (MPCA Leak #1057) or higher boiling hydrocarbons in the fill materials, and do not represent evidence of a new petroleum release.

- DRO was detected in soil sample B-3-2010 (1'-2') at a concentration of 1,130 milligrams per kilogram (mg/kg). Based on the field monitoring and laboratory data, the DRO concentration detected in this soil sample appears to be related to a previously unknown diesel/fuel oil type spill/release in this area.

- Chlorinated volatile organic compounds (VOCs), including trichloroethylene (TCE), cis-1,2-dichloroethylene (c-1,2-DCE), and vinyl chloride, were detected in ground water samples collected from borings GP-13A and GP-14. TCE was also detected in soil sample GP-13A (10'-12'). TCE degrades into c-1,2-DCE and vinyl chloride. The source of the TCE is unknown; however, TCE is commonly used as a degreasing solvent.

- Organic vapors were detected at a concentration of 10 ppmv in the soil sample collected from a depth of 1 to 4 feet bgs in boring GP-7. Laboratory analyses detected TCE, c-1,2-DCE, and chloroform at concentrations less than MPCA SRVs. The source of these chemicals is not known.

- PAH concentrations exceeding MPCA SRVs were detected in fill materials in the locations of soil borings GP-3, GP-7, GP-9 and GP-18. The PAHs appear to be associated with ash and/or slag in the fill materials.

- Metals, including arsenic, mercury and lead, were detected at concentrations exceeding MPCA SRVs in the majority of fill materials.

6.0 RECOMMENDATIONS

Based on the results of the LSI, the following recommendations are provided:

- The information regarding the petroleum release identified in soil boring B-3-2010 should be provided to Scherer Brothers Lumber Company in the event they want to notify the State Duty Officer.

- Chlorinated VOCs, including TCE, cis-1,2-DCE and vinyl chloride were detected in soil samples GP-7 (1-4') and GP-13A (10-12') and in ground water samples GP-13A-W and GP-14W. The source of these chlorinated VOCs is unknown. TCE is commonly used as a degreasing agent breaks down into cis-1,2-DCE and then into vinyl chloride as the final product. Additional investigation is recommended to determine the source and extent of this contamination.

- The uppermost approximately four feet of fill material on Site contains debris and elevated PAH and/or metal contamination. Any fill material exported during future redevelopment activities will have to be disposed of properly at a licensed facility. Fill materials with contaminant concentrations exceeding MPCA SRVs can remain on Site in less accessible locations (below a depth of four feet or beneath permanent structures) with institutional controls.

- Additional work will be necessary to obtain MPCA approval of response actions for future development. Additional investigation is recommended to further assess the extent of the VOC and metal contamination identified in soil boring GP-7 and the extent of metal contamination identified in soil boring GP-16.

- A Response Action Plan (RAP) should be prepared based on the proposed redevelopment of the Site. The RAP should be submitted to the MPCA Petroleum Brownfields (PB) and Voluntary Investigation and Cleanup (VIC) Programs for review and approval prior to initiating any redevelopment activities.

APPENDIX A

Standard Operating Procedure 211
Field Log Preparation

Purpose

Logs of individual borings completed in the field are the basis for printed logs and written field reports. Collecting the right information in the field is key to accurate and informative logs and reports.

Required Equipment

- Blank log form (boring, sampling probe, trench, etc.) or field notebook.

Procedure

1. A day or two before the field work, review the written scope of work with the project manager. The scope should define the boring numbering scheme, boring locations, depths, sample intervals, and types of samples to be collected. Make sure that all required field equipment is prepared and in good working condition.

2. In the field, identify the boring locations with the drilling subcontractor. Discuss the sampling procedures to ensure they meet the scope of work. In particular, discuss sample intervals and water sampling, if appropriate.

3. The drilling subcontractor will collect soil samples from the sample intervals and provide the samples to the field technician. The field technician is responsible for making field observations of the soil, screening soil samples for volatile organic vapors, and collecting soil or water samples for laboratory analysis.

4. If the material at the surface is less than six inches thick, indicate the material at the surface of the borehole (e.g., 4" concrete, asphalt, grass, gravel, etc.) in the Remarks section of the log form.

5. On the log form, indicate (in feet) the sample interval and recovery for each split spoon or probe sleeve provided by the subcontractor.

6. Collect a sample of the soil from each two-foot interval (or less) for organic vapor screening in the field (Peer SOP 212). Record the results of the vapor screening on the log form.

7. As soil samples are collected in the field, a visual identification and description will be completed as described below. Portions of the *Standard Practice for Description and Identification of Soils* (ASTM D2488-93) were used to prepare this SOP and soil descriptions should follow that document as applicable.

When visually describing soils in the field, the following information should be provided at a minimum. Field technicians capable of more-detailed and correct descriptions are encouraged to provide additional detail.

Prepare the soil description **in the order shown**.

a. A description of the main soil group within the sample (e.g., silty sand, clay, silt, etc.).

b. Optional. If coarse-grained soil (i.e., sand or gravel), include a brief description of the predominant particle grain size(s) (e.g., fine, medium, coarse).

c. Optional. If fine grained soil (i.e., clay or silt), describe the consistency based on finger pressure (e.g., very soft = thumb will penetrate soil more than 1 inch, soft = thumb will penetrate soil about 1 inch, firm = thumb will penetrate soil about ¼ inch, hard = thumb will not indent soil, but thumbnail will easily make a mark, very hard = thumbnail will not indent soil).

d. If another soil group is present in the sample describe its concentration with an adjective based on the percentages present within the sample (i.e., trace = < 5%, few = 5 to 10%, little = 10 to 25%, some = 30 to 45 %).

e. Describe the overall moisture of the soil sample using the terms dry, moist, or wet (do not use the term "saturated").

f. Describe the color of the main soil group (e.g., brown, gray, etc.).

g. Be sure to note the presence of any unusual occurrences (e.g., bricks, glass, debris, petroleum odor). Include the specific depth interval of the occurrence of unique material in the description or in the Remarks.

h. If the soil material is fill or probable fill, note in parenthesis [e.g., (fill), (probable fill)].

The following are examples of correct visual soil classifications:

- *Silty sand, fine to medium grained, with few gravel, moist, dark brown.*
- *Sandy clay with trace gravel, soft, wet, gray, petroleum odor (fill).*

8. If and when ground water is encountered, note the depth to water in the log.

9. As samples are collected for laboratory analysis (see Peer SOP 215, SOP 321, or SOP 322) note the sample name, analyses requested and time collected in the Remarks section. For example:

- *SP-1(8-10') DRO, GRO, VOCs @ 10:15*
- *SP-1 DRO, VOCs @ 10:45*

10. At the termination of the borehole record the final boring depth and the material used to backfill the borehole. Note if the borehole met refusal.

Standard Operating Procedure 212
Organic Vapor Screening

Purpose

Use this procedure to obtain a fast, general measurement of volatile organic compounds in soil.

Safety Equipment

- Wear nitrile gloves to reduce the incidence of skin contact with potentially contaminated soil and to reduce the risk of cross-contamination.

- Refer to the site-specific Health and Safety Plan for other safety concerns and applicable personal protective equipment.

Required Equipment

- Photoionization detector (PID) equipped with a 10.6 eV lamp (use an 11.8 eV lamp only if required by a site-specific sampling and analysis plan)

- PID calibration equipment

- One quart sealable bags, or soil jars, lids and aluminum foil

- Appropriate log forms or note pad for field notes

- Sharpie or permanent marker

Procedure

1. Select a PID on the afternoon before the field work is scheduled and charge the battery overnight by plugging in the adapter. As the PIDs have no battery gauge, failure to recharge the battery may leave you with a discharged battery and an unusable PID.

2. Calibrate the PID upon arrival at the site or prior to leaving the office. Record all pertinent information on the calibration record located in the case of each PID and record the calibration on the Field Report form.

3. With a gloved hand, fill a dedicated sealable bag or soil jar approximately half full with soil to be screened. Refer to the site-specific sampling and analysis plan or work plan for appropriate sample container. Manually break up the soil clumps within the bag. Seal the bag, or cover the opening of the soil jar with aluminum foil and screw on a lid. Use a marker to write the sample identifier and depth on the bag or jar lid.

4. Shake the sealed bag or soil jar for approximately 15 seconds, then allow the soil to volatilize for at least 10 minutes in an atmosphere of at least 70°F. On cold days it may be necessary place the bag or soil jar inside a heated room or vehicle.

5. After headspace development, shake the sample for another 15 seconds.

6. Complete organic vapor screening within approximately 20 minutes of sample collection. If using soil jars, remove the lid. Pierce the aluminum foil or plastic bag with the probe of the PID. Record the highest meter response within a time period of two to five seconds.

7. Discard the soil samples on-site and dispose of used bags, soil jars, foil, and lids as trash.

Standard Operating Procedure 215
Collecting Soil Samples for Laboratory Analysis

Purpose

Use this procedure to collect soil or other solid media samples for laboratory analysis. Proper sample collection technique will improve the accuracy of results and will help avoid cross contamination.

Safety Equipment

- Wear nitrile gloves to reduce the incidence of skin contact with potentially contaminated soil and to reduce the risk of cross-contamination.

- Refer to the site-specific Health and Safety Plan for other safety concerns and applicable personal protective equipment.

Required Equipment

- Laboratory sample containers
- Clean cooler(s)
- Temperature blank bottle
- Trip blank for VOC sampling (SOP 327)
- Ice or frozen cold-packs
- Electronic scale (except for VOC by Method 5035/8260)
- Permanent marker
- Sealable bags
- Laboratory chain-of-custody form
- Sampling syringe, such as Terra Core or Easy Draw sampler (required for VOC Method 5035/8260)

Procedure

1. Several days before field work is scheduled to begin, call or email the laboratory or other lab supply source to order sample containers. Be sure to order extra bottles to allow for breakage, extra samples, etc. If you are unsure of the required sample volumes or proper laboratory sample containers for specific analytical parameters, ask that a written description be included with the bottle order which clarifies sample requirements.

2. Before you leave for the field, check the contents of the cooler to be sure that you have the appropriate sample containers and that extra containers are included. Be sure you are aware of sample volume and container requirements.

3. Place ice or a frozen cold pack into each sample cooler before collecting any samples. Double-bag the ice in sealable gallon bags to avoid potential contact of water in the cooler with sample containers.

4. Place a temperature blank into each cooler and under the ice.

5. If some samples may be analyzed for GRO, BETX, or VOCs, include a trip blank in each cooler as described in SOP 327.

6. Before taking a sample, put on a new pair of nitrile gloves.

7. A sample taken for volatile organic analysis is to be taken immediately after the soil is exposed (i.e., directly from the probe sleeve or auger split spoon, excavation side wall, hand auger, etc.). Do not disturb or mix a VOC sample. Never collect a sample from the sealable bag used for organic vapor screening (SOP 212). Samples for DRO are to be collected second and samples for non-VOC or non-DRO analysis are taken last.

8. Prior to GRO (step 9) or DRO (step 10) sample collection the scale must be verified to read a mass of greater than 50 grams within one gram of the expected result. Place a weight of known mass (calibration mass or pre-weighed bottle) on the scale and verify the reading. If the reading is within one gram of the expected result the scale is usable. Record the weight verification on the Field Log. If the reading is more than one gram from the expected weight the scale must be re-calibrated (see SOP 218 if applicable) or a scale that is verified to be correct must be used.

9. Samples collected for GRO, BTEX, or VOCs need to be placed into one pre-weighed glass container and a separate container for determining moisture content. Most labs provide containers including the preservative methanol; however some labs supply a measured volume of methanol in a separate container that must be added to the container after adding the sample. Depending on the laboratory the glass container will have a capacity of either 60 ml or 40 ml. 60 ml containers must be filled with approximately 25 grams of soil (can be between 20 and 35 grams) and 40 ml containers must be filled with approximately 10 grams of soil (can be between 8 and 12 grams).

    a. VOCs by Method 5035/8260 – Use a dedicated sampling syringe to collect the appropriate volume sample and place it directly into the sample container.

    b. GRO, BTEX and VOCs by other methods – Place one soil container on the scale and zero the scale. Carefully add approximately 25 (or 10) grams (depending on laboratory requirements) of soil to the container. <u>During filling, do not mix or aerate the sample.</u> Sample containers with more than 35 (or 12) grams of soil or less than 20 (or 8) grams of soil may be rejected or flagged as outside testing parameters by the laboratory.

    In addition, if there is no non-volatile analysis, fill a plastic vial or plastic whirl-pak bag with soil to be used by the lab to calculate the moisture content of the soil. The soil in the plastic vial or plastic whirl-pak bag need not be weighed.

10. Samples collected for DRO need to be placed in <u>two</u> pre-weighed glass containers with *no methanol* and one plastic vial (if necessary), using the procedure described in step 9, above. If collecting samples for both DRO and VOCs/GRO only one moisture container is required.

11. Samples for non-volatile analysis (i.e., metals, PCBs, pesticides, semi-VOCs, etc.) are to be thoroughly mixed prior to sampling. Place the sample in a resealable plastic bag and shake the bag for at least 10 seconds. Sample containers should be filled, but not packed, with soil from the bag.

12. Before placing the lid back on the sample container, clean the jar threads to assure a tight seal.

13. After collecting soil samples, use a permanent marker to label the sample containers with the project name, sample identifier including depth interval, time, date, and your initials.

14. Place the filled sample containers for each interval in their own sealable bag. Larger, more fragile containers should be placed in bubble wrap to avoid breakage. Place the sample containers and bags into the cooler immediately.

15. When all samples are collected, complete the laboratory chain-of-custody form and arrange for shipment to the contract laboratory (as described by SOP 620 – Chain of Custody Procedures, SOP 630 – Sample Shipping – Peer or Local Carrier, and SOP 640 – Sample Shipping – Overnight Carrier).

Standard Operating Procedure 219
Calibration and Verification of a MiniRAE Lite PID

Purpose

Use this procedure to calibrate and verify that the response of the PID to a known concentration of an organic gas (isobutylene) is correct.

Safety Equipment

- Refer to the site-specific Health and Safety Plan for other safety concerns and applicable personal protective equipment.

Required Equipment

- Rae Systems model MiniRae Lite photoionization detector (PID) equipped with a 10.6 eV lamp
- 100 ppm isobutylene gas cylinder, associated flow regulator, and poly tubing assembly to connect the gas cylinder to the PID
- Photoionization Detector Calibration Record

Procedure

Calibration and verification of the PID is best completed at the job site, however calibration in the office on the day of the work is acceptable.

1. Screw on the probe tip assembly.

2. Push the MODE key (top, middle button) to turn the instrument on. The instrument performs self-tests. When tests are complete, display will read "Ready…Start Sampling?"

3. To start calibration, hold down the MODE key and the N/- key simultaneously for approximately 5 seconds until you see the "Password" screen.

4. No password is needed to calibrate the instrument. To start the calibration press the MODE key. "Calibration" screen is visible with the "Zero Calib" highlighted.

5. Press the Y\+ key to select the "Zero Calib"

6. Be sure the PID is in "zero" / fresh air. Press the Y\+ key to start the zero gas calibration. Zeroing calibration starts a 30-second countdown.

7. When zeroing is completed the screen says "Zeroing is done! Reading = 0.0 ppm". After 5 seconds the screen will return to the Calibration screen and "Span Calib" will be highlighted.

8. Press the Y\+ key to select the "Span Calib".

9. The screen will say "C. Gas = Isobutene. Span = 100 ppm. Please apply gas 1". Attach the calibration gas to the probe with the poly tubing and turn on the gas by pressing in and turning the valve. The calibration process starts immediately and starts a 30 second countdown.

10. When the instrument has completed its automatic calibration the screen displays "Span Gas 1 Complete" and the reading in ppm is displayed. The reading should be close to 100 ppm. After 5 seconds the display returns to the Calibration screen.

11. Close the calibration gas valve and disconnect the tubing to the gas source.

12. Push MODE key to exit out of the calibration and return to the "Ready…Start Sampling?" screen.

13. Press the Y\+ key to start sampling.

14. Calibration Verification. With the gas source attached to the PID with the poly tubing, open the valve on the calibration gas and check to make sure the instrument reading equals the calibration gas concentration (100 ppm). If the zero air or calibration gas reading varies more the 2 ppm from the expected reading, repeat the calibration starting at step 3.

15. Record the date and time of the calibration or verification on the Calibration Record sheet along with the test status.

16. If the calibration does not complete normally, or if the instrument will not produce the expected reading during the calibration verification, note the failure and attempted remedy on the Calibration Record. After attempting a remedy, repeat the calibration from Step #3. If the calibration does not produce the expected result contact the office to obtain instructions for other potential remedies or to obtain a replacement photoionization detector. Do not use a PID that does not calibrate properly.

Standard Operating Procedure 223
Soil Sampling – Sampling Probe

Purpose

Use a sampling probe to collect soil samples for field screening and laboratory analysis.

Safety Equipment

- Steel-toed boots
- Ear plugs (recommended)
- Wear a dedicated pair of nitrile gloves for each sample to reduce the risk of potential cross-contamination between samples and to reduce the incidence of skin contact with the soil.

Required Equipment

- Measuring tape
- Sampling Probe Log forms

Procedure

1. Ensure all field equipment is clean before starting.
2. Determine the appropriate sample location and identification prior to sampling. Use a tape measure to determine the distance (within 1 foot) from site landmarks. Identify the sampling probe location with the letters "SP-" (or other specified identifier) followed by a number unique to that site. Begin with number 1 and sequentially assign numbers for all sampling probes advanced at the site.
3. Advance the probe to the desired sampling depth.
4. A sampling probe is driven into the soil by a hydraulic hammer and ram. The length and inside diameter of the sampler used is determined by the sampling depths or intervals desired. The standard sampler has a length of either two feet (1 inch diameter) or four feet (2 inch diameter).
5. The probe operator will bring the sampler to the surface and remove the inner plastic tube. Record the length (in feet) of sample recovery (length of soil column) in the tube.
6. Cut the tube open lengthwise for sample removal. Use a gloved hand to transfer the soil from the tube directly into a sample container as described in SOP 215 –

Collecting Soil Samples for Laboratory Analysis. If there is a soil change within the tube, a sample should be taken of each stratum and note its location in your notes.

7. Record the sample identifier, depth, and time of sample collection on the sample container. Examples of properly labeled samples are: SP-1 (6") or SP-2 (8-10'). Record pertinent information about the sample location and write a description of the soil samples recovered in Sampling Probe Log form using SOP 211 – Field Soil Classification.

8. Be sure the probe operator decontaminates the sampler between samples to minimize cross contamination using a brush in a detergent and water wash, followed by a clean water rinse. A new plastic tube is used for each sample.

9. Discard gloves and use new gloves for the next sample interval.

Standard Operating Procedure 224
Soil Sampling – Split Spoon Sampling

Purpose

Use a drill rig and split barrel (spoon) sampler to collect soil samples for field screening and laboratory analysis.

Safety Equipment

- Hard hat
- Steel-toed boots
- Ear plugs (recommended)
- Wear a dedicated pair of nitrile gloves for each split spoon sample to reduce the risk of potential cross-contamination between samples and to reduce the incidence of skin contact with the soil.

Required Equipment

- Measuring tape
- Boring Log forms

Procedure

1. Ensure all field equipment is clean before starting.
2. Determine the appropriate location and identification prior to sampling. Use a measuring tape to determine the distance (within 1 foot) from site landmarks. Identify the boring location with the letters "SB-" (or other specified identifier) followed by a number unique to that site. Begin with number 1 and sequentially assign numbers for all soil borings advanced at the site.
3. Advance the boring to the desired sampling depth.
4. Bring the sampler to the surface and open. Record the length (in feet) of sample recovery in the split-spoon, and write a description of the soil samples recovered in the Boring Log form as described in SOP 211 - Soil Classification.
5. Use a gloved hand to transfer the soil from the sampler directly into a sample container as described in SOP 215 – Collecting Soil Samples for Laboratory Analysis. If there is a soil change within the sampler, a sample should be taken of each stratum and note its location in your notes.

6. Record the sample identifier, depth, and time of sample collection on the sample container. Examples of properly identified samples are: SB-1 (6") or SB-2 (6-8'). Record pertinent information about the sample location and sample content in the Boring Log form.

7. Be sure the drill rig operator decontaminates the split barrel sampler between samples to minimize cross contamination using a brush in a detergent and water wash, followed by a clean water rinse.

8. Discard gloves and use new gloves for the next sample interval.

Standard Operating Procedure 311
Water Level Measurement

Purpose

To determine the distance from the top of the well casing to the potentiometric surface of the ground water in a well. This data allows calculation of ground water flow direction or well hydrographs.

Safety equipment

Wear nitrile gloves to reduce the incidence of skin contact with the potentially contaminated water and to reduce the risk of cross contamination.

Required Equipment

- Water level indicator
- Well keys
- 9/16" or 5/8" socket with wrench or triangle tool for at-grade wells
- Distilled water and squirt bottle
- Alconox
- Monitoring Well Sampling Data forms or note pad

Procedure

1. Test the battery of the water level indicator by pressing the black button. You should hear a beep and see a red light.

2. If a well has a recent history of free product or if free product is suspected, use the Product Probe to get water level information, thus avoiding excessive instrument contamination (see SOP 312).

3. Ensure that the water level indicator is clean before starting.

4. Remove the monitoring well covers and j-plugs. Wait at least ten minutes before measuring the water level; this allows the static water level to adjust to isostatic pressure.

5. Determine sampling order prior to starting. Always start with the cleanest well and work progressively towards the most contaminated; this decreases the risk of cross contamination.

6. Turn the water level indicator on before placing it into the well. Use the water level indicator to measure the distance from the top of the well riser to the surface of the water. Read the measured water level to the nearest 0.01 feet and record accurately in the Monitoring Well Sampling Data form or field notes. Because the top of the riser is not always straight, measure to the north edge of the riser or to a measuring mark on the riser, if present. Be especially careful with steel risers not to let the tape run down the edge of the riser. Riser edges can be sharp and can cut through the plastic tape, eventually leading to instrument failure.

7. Before moving to the next well or if all well measurements are complete, decontaminate the probe body and connecting tape as described in SOP 810.

Standard Operating Procedure 319
Filling Water Sample Containers for Laboratory Analysis

Purpose

After a water sample has been obtained by the appropriate method the sample must be poured into the appropriate container by the correct procedure.

Safety Equipment

- Wear clean nitrile gloves to reduce the incidence of skin contact with contaminants and to prevent cross-contamination between sampling locations.

Required Equipment

- Laboratory-supplied sample containers
- Clean cooler(s)
- Ice or frozen ice packs
- Temperature blank bottle
- Trip blanks for VOC sampling (see SOP 327)
- Disposable 0.45 micron water filtration unit with vacuum pump and pre-filters (if necessary)
- Sealable plastic bag or bubble wrap bag

Procedure

1. Several days before field work is scheduled to begin, call or FAX the laboratory or other lab supply source to order sample containers. Be sure to order extra bottles to allow for breakage, extra samples, etc. If you are unsure of the required sample volumes or proper laboratory sample containers for specific analytical parameters, ask that a written description be included with the bottle order which clarifies sample requirements.

2. Before you leave for the field, be sure that you have the appropriate sample containers and that extra containers are included. Be sure you are aware of sample volume and container requirements.

3. Place ice or a frozen cold pack into the sample cooler(s) before collecting any samples. Double-bag the ice in sealable gallon bags to avoid potential contact of water in the cooler with sample containers.

4. Place a temperature blank in each cooler and under the ice.

5. If some samples may be analyzed for GRO, BETX, or VOCs, include a trip blank in each cooler as described in SOP 327.

6. Before taking a sample, put on a new pair of nitrile gloves.

7. Water should be poured directly from the bailer or submersible sampling pump into the sample containers. Collect samples in the following order using the procedures indicated:

    a. Volatile organic compounds (VOCs) and/or gasoline range organics (GRO)/benzene, toluene, ethyl benzene, and total xylenes (BTEX). Collect VOCs and GRO/BTEX samples by tilting the pre-preserved vial to minimize aeration. Do not dilute the preservative by overfilling the vial too much. When properly filled, the water in the vial should display a positive meniscus. Cap the vial. Invert the vial and rap it against your hand to check for bubbles. If bubbles are present, uncap the vial and add only enough water to produce a positive meniscus.

    b. VOC or GRO/BTEX splits or duplicates (optional).

    c. Semivolatile organic compounds (SVOCs) and/or diesel range organics (DRO).

    d. SVOC and/or DRO splits or duplicates (optional).

    e. Metals and other inorganic parameters.

    f. Metals/inorganic splits or duplicates (optional).

8. Samples of dissolved metals must be filtered in the field. If the sample is silty or turbid, place a new pre-filter in a disposable field filtration unit. Carefully pour the sample from the bailer into the top of a new disposable water filtration unit. Attach the hand vacuum pump to the unit. Repeatedly squeeze the hand pump to create a vacuum and draw the water through the filter into the bottom of the unit. After the appropriate volume has been filtered, pour the filtered sample into appropriate sample container(s).

9. Label the sample containers with the location identifier (e.g., MW-2, GP-3 (10-12')). Include the site identifier, time, date, and sampler's initials on the sample label.

10. Put all sample containers from the same sample location into a single plastic bag or bubble bag. Place the sample containers into the cooler immediately. Cover all samples with ice.

11. When all samples are collected, complete the laboratory chain-of-custody form and arrange for shipment to the contract laboratory (as described by SOP 620 – Chain of Custody Procedures, SOP 630 – Sample Shipping – Peer or Local Carrier, and SOP 640 – Sample Shipping – Overnight Carrier).

Standard Operating Procedure 321
Ground Water Sampling from a Sampling Probe

Purpose

To collect a representative ground water sample from a sampling probe for laboratory analysis.

Safety Equipment

- Wear clean nitrile gloves to reduce the incidence of skin contact with contaminants and to prevent cross-contamination between sampling locations.

Equipment

- Sampling Probe Log form

Procedure

There are three major steps to obtaining a ground water sample from a sampling probe:

1. Advance the probe to the appropriate depth and prepare the sampling equipment.
2. Collect the ground water sample.
3. Fill the appropriate sample container(s).

The three steps may be accomplished by a number of methods, depending on the site requirements and sampling probe contractor. The methods are described as follows.

Advance the Probe and Prepare to Sample

The sampling probe operator will advance the probe to the depth you specify and prepare the sampler for ground water collection. The operator may use one of the two following methods:

1. In the case of shallow ground water and a fairly competent soil formation, the operator advances the sampling probe to the desired depth for ground water sampling. All sampling probe equipment is removed from the probe hole. A length of ¾-inch diameter PVC pipe with a five or ten foot screened portion on the bottom is extended

down the open hole. Ground water samples are collected from inside the screened portion of the PVC pipe.

2. In many cases the operator advances a special sampling probe to the desired depth for ground water sampling. The tip of the probe will be an "expendable point" which is snugly attached to the probe. Inside the probe is a 4 foot long stainless steel screen section. The sampling probe is pulled up, releasing the expendable point and exposing the screen. Ground water samples are collected from the inside of the screen.

Collect the Ground Water Sample

The sampling probe operator will then collect the ground water sample from inside the PVC pipe or the sampling probe. One of the three following methods may be used:

1. Plastic tubing with a bottom check valve
2. Plastic tubing attached to a peristaltic pump
3. Small-diameter bailer

The three methods for collecting ground water samples are describe in detail as follows:

Plastic tubing with a bottom check valve

a. A length of new plastic tubing with a clean, bottom-mounted, stainless steel check valve is inserted down the inside of the PVC pipe or sampling probe body.

b. The tubing is manually oscillated up and down, pushing the water sample upward into the tubing as the ball repeatedly lifts and seats. The tubing will fill with water.

c. Once filled, the tubing can either be lifted out of the probe hole and water poured into the sample containers or the sample containers can be filled from the top while the tubing is being pumped. The later process may be used for multiple sample containers. Once the sample containers are filled, the tubing is removed from the PVC pipe or sampling probe body.

Plastic tubing attached to a peristaltic pump

a. A length of new plastic tubing is inserted down the inside of the PVC pipe or sampling probe body. The top end of the tubing is attached to a fitting on the peristaltic pump. (Optionally, the tubing could be attached to a nipple on the lid of a 1-liter container. One end of a second tube is attached to a second fitting on the lid of the container and the other end of the tube is connected to the peristaltic pump.)

b. The pump is activated and water is drawn into the tubing by vacuum. When the tubing is full of water the pump is shut off and the tubing is manually kinked to prevent water from flowing back down the tubing.

c. The tubing is removed from the probe hole and water is poured from the tubing into the sample containers. The peristaltic pump may be reversed to push water out of the tubing.

Small diameter bailer

a. Attach clean rope to a new, small diameter bailer. Slowly lower the bailer into the PVC piping or sampling probe body and allow the bailer to fill with water. Once full, raise the bailer out of the well by grasping a section of cord using each hand alternately. This bailer lift method is used so that bailer rope will not come into contact with the ground or other potentially contaminated surfaces.

b. Water should be poured directly from the bailer into the sample containers.

<u>Fill the Sample Containers</u>

1. Fill sample containers as described in SOP 319 - Filling Water Sample Containers for Laboratory Analysis.

2. Indicate the sample depth and analytical parameters on the Sampling Probe Log form.

Standard Operating Procedure 327
Trip Blanks

Purpose

The purpose of a trip blank is to detect any volatile compounds that may enter sample containers during the process of container transport, sample collection, sample transport or sample analysis. A trip blank is to be placed in all coolers that are to contain samples analyzed for GRO, BTEX, or VOCs.

Safety Equipment

- Nitrile gloves to reduce the incidence of skin contact with sample preservatives.

Required Equipment

- Water – Two 40 ml glass vials with HCl preservative
- Water – Carbon-filtered tap water
- Soil – One 60 ml glass container with methanol preservative

Prior to leaving the office, be sure that appropriate trip blanks are present in each cooler.

Procedure - WATER

1. Preparation of trip blank.
    a. The laboratory will provide VOC trip blanks with every bottle order.
    b. If there is no existing trip blank prepare a trip blank by pouring carbon-filtered water into two HCl-preserved sample vials in the office prior to leaving for the field. Fill the vials by tilting the pre-preserved vial to minimize aeration. Do not dilute the preservative by overfilling the vial too much. When properly filled, the water in the vial should display a positive meniscus. Cap the vial. Invert the vial and rap it against your hand to check for bubbles. If bubbles are present, uncap the vial and add only enough water to produce a positive meniscus.
2. Label the containers using the identifier TB, TB-#, or a blind identifier, as necessary.

3. Place two vials into each cooler to be used to hold the field-collected samples.

4. Preserve and handle trip blanks in the same manner as investigative samples. Trip blanks will be analyzed for GRO, BTEX or VOCs only.

Procedure – SOIL

1. Preparation of trip blank.

    a. The laboratory will provide VOC trip blanks with every bottle order.
    b. If there is no existing trip blank; label a methanol-preserved sample container using the identifier TB, TB-#, or a blind identifier, as necessary.

2. Place a container into each cooler to be used to hold the field-collected samples.

3. Preserve and handle trip blanks in the same manner as investigative samples. Trip blanks will be analyzed for GRO, BTEX or VOCs only.

Standard Operating Procedure 610
Sample Preservation

Purpose

Sample preservation techniques are intended to prevent substantial alteration of the chemical species present in the sample at the moment it was collected.

Required Equipment

- Clean cooler with temperature blank bottle
- Ice or frozen cold packs
- Sample containers with media

Procedure

1. Immediately after media collection, all sample containers will be placed in a clean cooler under ice, to thermally preserve the samples. The cooler must also contain a temperature blank bottle, also kept under the ice.

2. The sample containers will be kept in an environment that is between 0° and 4° Celsius until the laboratory receives the samples. The sample custodian must ensure that some ice remains in the cooler and that excess water from melted ice is drained.

3. In addition, chemical preservatives may be added to individual samples depending on the analytical methods required. In general, the laboratory will supply pre-preserved sample containers for the project and only laboratory-grade preservatives will be used.

Standard Operating Procedure 620
Chain of Custody Procedures

Purpose

The purpose of following chain of custody procedures is to maintain the quality of all samples during collection, transportation, and storage prior to analysis. Chain of custody documentation serves three main purposes:

1. Communication of analytical instructions from Peer to the analytical laboratory.
2. Permanent record of samples provided to the laboratory.
3. Documentation that samples were handled only by authorized personnel and were not available for tampering prior to analysis.

Procedure

Field personnel will complete sample labels and chain of custody forms to be used for tracking samples.

Sample Container Labels

1. Each sample will be assigned a unique identification number that will be affixed to a label on the sample container.
2. Additional information such as sampling location, date and time of collection, and person who collected the sample will also be included on the sample labels.
3. Labeled sample containers, a temperature blank bottle, and ice will be included in each cooler to be shipped to the laboratory.

Chain of Custody Form(s)

If multiple coolers are required to contain all samples from one sampling location, a separate chain of custody form will be prepared for each cooler. At a minimum, the chain of custody form will include the following information:

- Client or project name, or unique identifier, if confidential
- Sample collector's name and signature
- Peer's mailing address and phone number
- Name of project manager or person who will receive data
- Analytical laboratory's name and city

- Description of each sample including
  - Unique identifier and matrix (solid, aqueous, etc.)
  - Date and time of collection
  - Type of analysis required
- Temperature blank listed as a sample
- Dated and timed signatures of persons involved in chain of possession
- Date and method of shipment

Completion of Field Personnel Responsibility

Record all pertinent information about the samples on the field sampling forms or in the field logbook. Upon completion of the chain of custody forms, field personnel will sign the chain of custody forms along with the date and time.

If the field personnel will transfer the custody of the samples to someone other than the laboratory, affix a custody tape to the cooler to prevent the lid from opening. Write the time, date, and initials on the custody tape.

Sample Custody

Each time the custody of a sample or group of samples is transferred, a signature, date, and time will be entered onto the chain of custody form. A sample will be considered to be in custody if it is in any one of the following states:

1. In actual physical possession
2. In view, after being in physical possession
3. In physical possession and locked up so that no one can tamper with it
4. In a secured area such as a locked storage shed or locked vehicle, restricted to authorized personnel

NOTE: While samples are in an individual's custody, they are to ensure that the cooler containing the samples has ice or a frozen cold pack.

Standard Operating Procedure 630
Sample Shipping – Peer or Local Carrier

Purpose

Proper packaging methods and shipment of samples by Peer or a local carrier will:

- Minimize the potential for sample breakage, leakage, or cross contamination.
- Provide a clear record of sample custody from collection to analysis.

Safety Equipment

Wear clean nitrile gloves when handling coolers or sample containers to reduce the incidence of skin contact with contaminants.

Required Equipment

- Coolers or similar shipping containers
- Ice or cold packs
- Temperature blank bottle
- Sample containers with media
- Sealable plastic bags
- Protective wrapping and packaging materials
- Paper towels
- Chain of custody forms

Procedure

1. Verify that each sample container has been labeled with unique sample identification. The sample identification should also correspond to the chain of custody record that will accompany the sample to the laboratory (see SOP 620 Chain of Custody Procedures).

2. Ensure that a temperature blank bottle is in each cooler and included on the chain of custody form.

3. Any dirt on the outside of sample containers should be wiped clean with a paper towel.

4. Optionally, place sample containers inside of sealable plastic bags to reduce the potential for cross contamination or breakage during sample transport. If necessary, protective material should be placed between sample containers to prevent breakage during transport.

5. Reusable cold packs or ice placed in sealable plastic bags should be distributed over the top of the samples. Frozen cold packs or ice must remain in the cooler until the samples reach the laboratory.

6. Place the chain of custody record on top of or inside the cooler.

7. The filled cooler and completed chain of custody form must be delivered to the laboratory before the close of the next business day after sample collection (never longer than 72 hours). One of the following methods will be used:

    a. The sampling technician will personally deliver the samples to the laboratory.

    b. The sampling technician will bring the samples to the Peer office for later pickup by laboratory representative or bonded courier. The technician may either contact the laboratory directly to arrange pickup or transfer custody of the samples to the Peer receptionist. If custody is transferred to the receptionist, the receptionist will contact the laboratory and maintain responsibility for the sample custody, sample condition, and timely pickup.

RE: Project: 20028 SCHERER LUMBER
Pace Project No.: 10127568

Dear Ms. Reason:
Enclosed are the analytical results for sample(s) received by the laboratory on April 28, 2010. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Carol Davy for
Diane J. Anderson

QUALIFIERS

Project: 20028 SCHERER LUMBER
Pace Project No.: 10127568

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

U - Indicates the compound was analyzed for, but not detected.

ANALYTE QUALIFIERS

D3	Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.
M0	Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
S4	Surrogate recovery not evaluated against control limits due to sample dilution.

RE: Project: 20028 Scherer Lumber Revised.
Pace Project No.: 10127340

Dear Ms. Reason:
Enclosed are the analytical results for sample(s) received by the laboratory on April 26, 2010. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

This report has been revised to include TCLP data for samples GP-7 (1-4) and GP-15 (0.5-3).

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Diane J. Anderson

QUALIFIERS

Project: 20028 Scherer Lumber Revised.
Pace Project No.: 10127340

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

U - Indicates the compound was analyzed for, but not detected.

ANALYTE QUALIFIERS

CH	The continuing calibration for this compound is outside of Pace Analytical acceptance limits. The results may be biased high.
D3	Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.
E	Analyte concentration exceeded the calibration range. The reported result is estimated.
L0	Analyte recovery in the laboratory control sample (LCS) was outside QC limits.
L1	Analyte recovery in the laboratory control sample (LCS) was above QC limits. Results may be biased high.
M0	Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.
P4	Sample field preservation does not meet EPA or method recommendations for this analysis.
P6	Matrix spike recovery was outside laboratory control limits due to a parent sample concentration notably higher than the spike level.
R1	RPD value was outside control limits.
S0	Surrogate recovery outside laboratory control limits.
S5	Surrogate recovery outside control limits due to matrix interferences (not confirmed by re-analysis).
T6	High boiling point hydrocarbons are present in the sample.
